The GodTech Order

With technology advancing at such amazing rates the brilliant minds of the world banded together to form a secret society. They dubbed it The GODTECH Order. Their mission: to use their superior intelligence to help humanity. There were ten members in this order. Doctor Franklin Moore and Doctor James Weston were founding members. They were later joined by Charles Freelance and Peter Dwayne (IntelTech). The remaining members included Chase O'Hare (BioTech Scotland), Qin Yu (ChiTech), Yuri Snavel (Ukraine Research), Dobs Martin (MIT), Chen Lopez (Brazil AirTech), and Foster Kain (Global News).

History of GodTech

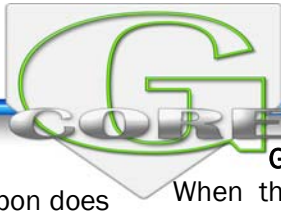

Doctor Franklin Moore and Doctor James Weston were old college roommates who didn't like how the world was abusing technology. Instead of working to help humanity, many researchers were making bigger, badder weapons to kill. Moore and Weston were furious and started a secret order. They called it GodTech. To be a member, one must have demonstrated a compassion for humanity and a dedication to technology. It didn't take long for their mission to deviate, when they recruited the world's biggest weapons manufacturer into their mix, Charles Freelance of Freelance International. But for every weapon he built, Charles also committed technology to saving lives. Soon after that they procured Peter Dwayne, a brilliant computer programmer who had designed several artificial intelligences for Japan. Chase O'Hare was picked up after she introduced the world to artificially grown limbs. In Japan, Qin Yu acquired membership after he built the first robotic defender for their country, in term keeping humans out of the front line battles against the atomic age monsters. Yuri Snavel, a Russian physicist was taken in after he defected from the Soviet Union. Dobs Martin found membership after his cybernetics research at MIT was used to improve life for amputees. Chen Lopez received his membership after designing the first rocket bike for D.A.V.I.D. with funding from Freelance International. The last member was a nose to the ground researcher who discovered the connection between all the GodTech members. Foster Kain was the owner of Global News, but he was also a beat reporter who liked to get out in the field. He stumbled upon a meeting of the GodTech members while researching a story on organized crime in Hong Kong. While some members suggested making him disappear, Moore, Freelance and Weston chose to offer the newsman a membership instead, citing a need for an information broker.

By 2000, GodTech had set up dozens of research facilities across the planet, each one specializing in a different aspect of technology and each controlled by the GodTech member who specialized in that field. In 2005, the members began to see the threat from super beings. With hundreds involved in the global Guardian Program, GodTech went to work building their own version of a super hero. The first was Spector, an android with artificial intelligence. The machine's power source

was a strange crystal that was discovered in the Nevada desert. The energy emitted both natural and unnatural energies. Spector was given a sense of justice. Unfortunately, the android became too aware and left GodTech, which didn't go over well with the members. Their next machine was the android Red Volcano, a brutish creation using a magma fluid as blood. It was designed with the specific purpose of testing the strengths of super beings.

But 2010 would put GodTech to the true test. The War of the Worlds! The Martian invasion hit fast and hard. While the Guardians and Galactic Guardians fought to maintain a front in major cities, GodTech built their first series of combat robots, utilizing both Galactic Guardian tech and their own. Roboton was their first construct. Dwayne programmed it like a gladiator and let it loose in Germany. Qin then built MegaRoboton, a giant robot the size of the Martian tripods. It was assigned to Japan. Chase and Snavel built the XL Punisher War Machine aka XL Punisher, an adaptive living machine that could connect itself to any technology and absorb it. They released it in New York City, where it caused as much damage as the Martian ground troops. Freelance International unleashed their complete battle suit arsenal across the globe to help fight the Martians where no Guardian had been able to make a dent. GodTech succeeded on every front, but their final victory would be denied them as Omega stepped from the Oval Office and went to work taking down Martian tripods across Washington, DC, signaling the end of the War of the Worlds. The Martians signed a non-aggression treaty MarsPACK and went home.

GodTech didn't totally lose. They gained data on countless Guardians and their inventions were put to good use. They even got their hands on a Galactic Guardian's power disk. Using the knowledge gained, GodTech built the Star Shogun and assigned two pilots to it. Each was also given a GodTech power disk, which not only powered the Star Shogun, but it gave them access to the Galactic Guardian's dimensional forge, allowing them to pull from the space faring Guardians' arsenal. This gave GodTech even MORE technology to work with.

New Gear

***NOTE on Concussion Weapons:** The weapon does STUN damage, but also pushes back at whatever the rank of the weapon is. So a Concussion rifle that is ranked at 30 will do 30 stun damage and push back with a Might of 30.

Power Dampener

Cost: 30

This is a device that dampens super powers by three ranks. It can be set for different distances (10/30/50). The effect lasts as long as the dampener is activated. Any character with powers who goes near it will instantly suffer the penalty.

Power Nullifier

Cost: 40

This small remote sized device zaps super human powers completely, rendering any super human hit by it powerless. This **ONLY** works on beings whose powers are 40 rank or LESS. Anything above will ignore the weapon. When used in sync with the Power Dampener it can ruin a powerhouse's day.

GodTech Galactic Guardian Form

When the GodTech Power Disk is activated the user is encased in a Galactic Guardian armor. It provides the following:

+20 to Agility and Might

Armor: 30 Rank

Full Life Support

Telepathic Communicator: 40 Rank

Full Access to Galactic Guardian Dimensional Forge

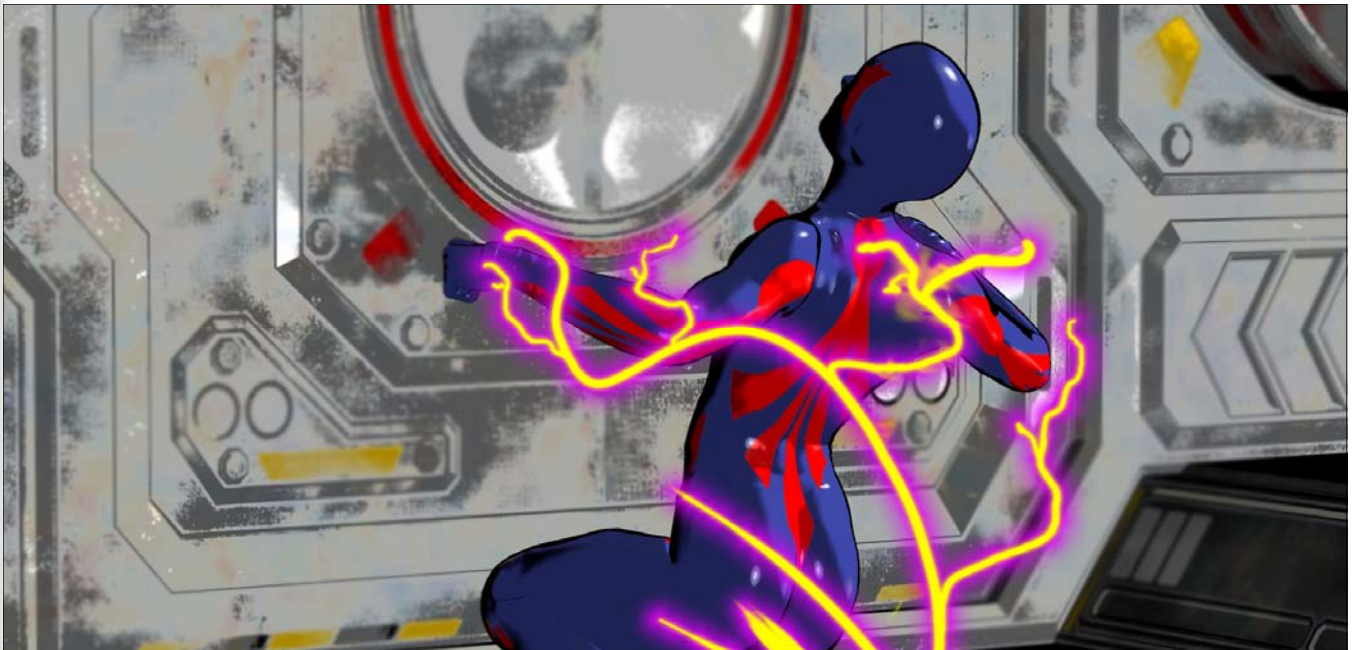

-Any Weapon: 10-50 damage

-Any Shield: 10-50 Rank armor

-Super Boosters: +30 to specific weapon and Stat (Lasts for 5 turns)

Quick Overview: GodTech Facilities

All GodTech facilities have 30 rank material walls and doors. Most have emergency doors at each junction. Each facility has a 30 Smarts Artificial Intelligence computer control system. There are usually staff quarters along with meeting rooms and research labs (based upon the focus of the facility). Small facilities have 10 Security Robots, larger facilities have up to 50.

Spector

Personality: Very noble and peaceful. Never raises its voice. Personality seems cold at times.

Allies: GodTech

Foes: Guardians

As the first attempt at artificial intelligence in a mobile form, Spector lived up to every expectation and more. The android lacked emotion, but its programmed sense of justice was strong. The designers place a Ying Yang symbol on its chest to represent this. Spector's body was made out of high density carbons and metals, with a special anti-radiation lining. The power source was an alien crystal found in the Nevada desert during the 1960s. GodTech determined that Omega might have actually gotten his powers from this same source. So why not use it to power their machine? What they didn't count on was an imprint of the alien child's essence on the crystal, which when linked to the artificial intelligence gave Spector more than just brains, he got a soul. Awake and active, Spector confronted his creators as to why they built the body. When no one gave the android the answer it wanted to hear, it teleported out of the facility to everyone's amazement because it wasn't supposed to have any powers. Spector wandered for a few years looking for purpose. It ended up in Tibet where it lived with monks and learned the way of balance. They explained the meaning of the symbol on its chest and taught Spector what it should do with its gift. The enlightenment of the monks gave Spector purpose. He went out into the world to bring balance where there was none. Its first stop was the local military base, where Chinese troops had been taking their political prisoners. Spector appeared above the installation and ordered the Chinese to release all their detainees. When they opened fire on the android, Spector simply vaporized them with a massive burst of energy. This attack drew the attention of the Guardians, who showed up in force to see what was going on. Spector immobilized dozens of Guardians until Omega arrived. Upon meeting, the two felt connected somehow. Spector explained itself and why it was acting against the Chinese. Omega ordered the Guardians to back off. Spector released the prisoners and vanished. The international incident brought trouble for the Guardians. But Spector didn't care. The Guardians, too, were lacking balance. During the War of the Worlds, Spector appeared at random helping the weak, but always maintaining order. If Martians surrendered and they were mistreated, Spector would appear and a battle would break out. No one knew whose side the android was on. When the war ended, Spector build a Temple of Peace in the North Pole, only forty miles from Tyrant's base. The temple is constructed out of ice and has only two chambers: one where Spector meditates and the hall of evil, where Spector has imprisoned dozens of evil-doers in ice stasis units.

Armor/Gear/Weapons

Name: Red Volcano

Personality: Very brutish. Not personable. Doesn't talk. Electronic grunts and roars.

Allies: GodTech

Foes: Guardians

Red Volcano (RV) is the second GodTech android in existence. It is powered by a unique magma blood with small micro power cells that float flow through the frame. It also allows it to breathe fire and increase its skin temperature to almost volcanic levels. Red Volcano was built in order to test Guardian strengths. The construction cost of the android is very affordable, so there are dozens in storage. GodTech will send out a RV whenever they need data about specific Guardians. Once they have what they need, the RV is ordered to retreat to a pickup location. RVs are programmed not to hurt innocents, but are free to do collateral damage to anything they need in order to accomplish their mission. The Red Volcano stands about eight feet tall and has the mass of a muscle-bound super human. It is physically powerful, making escape easy when the time comes. Most RVs won't go all out unless the super being pushes them that far. The RV storage base is Venezuela.

Name: Starlight Space Interceptor

Personality: Simple artificial intelligence with basic verbal skills. Not the greatest conversationalist.

Allies: GodTech, D.A.V.I.D

Foes: Aliens

The Starlight Space Interceptor is the newest android to come from GodTech. Instead of using it covertly, GodTech sold the units to D.A.V.I.D. to help keep aliens away from Earth after the War of the Worlds. Each Starlight is equipped with atmosphere to space rocket packs and powerful hand lasers capable of cutting through just about any metal, Earth or alien. The lasers can also be used as swords. The android itself uses a combination of Galactic Guardian tech and GodTech. The skin is made of a Galactic Guardian poly fiber, with super flex mesh weaved into it. The metal plating can reflect most light based attacks. The android is also equipped with a modified Galactic Guardian helmet that interacts with the android's face plate. It has several onboard sensors and can detect objects up to one million miles away. Starlight Space Interceptors are kept stored in orbiting launch stations, which not only keep them shielded from the effects of space, but also constantly keep them charged. When activated, a Starlight uploads all important data from the D.A.V.I.D. and GodTech networks and then goes to work. While D.A.V.I.D. has control over the Starlight, GodTech is able to override the android's programming at any time. This is usually reserved for instances when GodTech doesn't want anyone to know about an incoming alien ship. There are currently ten units in orbit, twenty in old missile silos and fifteen based at GodTech's Japanese facility.

Roboton

Designed using a blueprint from the Galactic Guardian forge and other God-Tech concepts, the group of scientists built Roboton. This human sized combat robot was built specifically to fight rogue super humans. Its casing can reflect most energy based powers and kinetic attacks. The combat computer is able to calculate possible attacks and act just as quickly. The interior is a powerful endo-frame that has super hydraulics, allowing Roboton to lift heavy objects. There is no personality in the robot's mind. It accepts tasks by GodTech and carries them out. Roboton is armed with a concussion rifle, heavy swords and chest cannons. It also has a detachable rocket pack for short flights. Roboton is stored in an abandoned subway station in Berlin, Germany manned by GodTech staff. When needed, the robot launches out of a back alley manhole and heads to its target.

MegaRoboton

One of the biggest creations to come out of GodTech is the MegaRoboton. The design had been in the works for decades, but the Martian invasion made it easy to justify the costs. Using alien tech, high density metals, reflexive motion systems, and a super Artificial Intelligence, Qin was able to truly build a masterpiece. The MegaRoboton is heavily armored, able to take hits from most Earth weapons. It has a large sword that emits a high frequency vibration, allowing it to cut through most metals. The hands can fire heavy concussion blasts and the eyes are equipped with a high density laser. The fingers are equipped with built in fire-extinguisher units. A massive detachable rocket pack allows the robot to fly and travel into space. MegaRoboton's AI doesn't speak aloud. Instead the robot just smiles when happy and frowns when sad. After each battle it poses for pictures and lets children play on its feet. MegaRoboton is stored in an old underwater missile silo in Tokyo Harbor. Here Qin keeps constant vigil over his creation. MegaRoboton is only used for the direst emergencies like stopping giant monsters and

Omega Class super beings. Sometimes Qin will bring out the robot for publicity photos. If there is one loved hero in Japan, it's this giant robot!

XL Punisher War Machine

During the first days of the Guardian hype in the 1980s, GodTech was working hard on a deterrent in case the super humans decided to conquer the world. The first attempt was a machine that could absorb metals and other machines. But shortly after it was activated, their creation went crazy and broke out of the lab. Ironically enough, the Guardians were able to destroy it. Speed ahead to the Martian invasion. Chase and Snavel, hoping to beat out the other members of GodTech in saving the world, opened up the security vault at GodTech's headquarters, removing the remaining pieces of the old crazy machine. Using their combined intelligence, the two managed to rebuild the robot's body and attached the old head. The minute they applied power the robot came to life. Chase and Snavel called it the XL Punisher War Machine. They thought that they could control the XL, but the minute they let it loose on the Martians, it began destroying everything. Yet with all the chaos, there was no one to stop the XL, who disappeared after the War of the Worlds. Chase and Snavel later tracked their creation down and managed to convince it to return to GodTech custody. How long this will last is a mystery. The XL is an unstoppable war machine. Just one small piece is enough to take control of materials so it can reconstruct itself. The XL's power source came from an alien weapon discovered by GodTech in the Alps. Little did they know that the energy source was alive and could transfer and absorb by simply touching raw material. The XL is currently housed in a warehouse in Trenton, New Jersey.

Security Robots

GodTech security robots are pretty simple machines that are programmed to protect GodTech facilities. They are cheap to produce, but are still very formidable against basic threats. The robots are armed with shoulder net launchers and an arm pulse cannon which can stun organics and zap machines. There are also shoulder dart launchers that can knock out even the toughest intruder. For amusement, GodTech even programmed basic personalities in order to keep staff from having robo-phobia. They offer fun greetings in all sorts of tones. The only time they aren't funny is when they are about to attack and their voice becomes serious. Some GodTech facilities are so important, that they arm their security robots with mini-guns.

GodTech Galactic Guardian Power Disk
 -Activates armor

Name: Logan

Personality: Military minded, with a scientific perspective. Cool mannered all around.

Allies: GodTech, Galactic Guardians

Foes: Enemies of humankind

Logan was one of the first artificially grown life forms to come out of GodTech. He has DNA from all the founding members and their intelligence to match. Wanting to make sure that Logan didn't turn into a crazy monstrosity, the members gave Logan a normal childhood. They had a well screened couple raise him and offered guidance from afar. Logan excelled at just about everything he did. GodTech kept him away from the super human phenomenon that was sweeping the globe. When Logan was old enough he went to Bean University in Boston, Massachusetts where he got his Master's in engineering. After that he went right to work for one of GodTech's fronts. During the War of the Worlds, Logan spent his time working on the Star Shogun with the other lead engineers. The machine was a technological masterpiece and GodTech rewarded Logan by giving him Galactic Guardian tech and made him the lead pilot of his creation. Some members of GodTech feel that maybe Logan takes too much enjoyment out of being a super hero of sorts. He is constantly working on ways to improve his personal armor and weapons, hoping to one day to be able to go toe to toe with big threats without his giant robot.

GodTech Galactic Guardian Form

-Activates armor
-Keeps GIA energy contained.

Name: Linda Martin

Personality: Dominant attitude about everything. She likes to be in control and has no problem telling people.

Allies: GodTech, Galactic Guardians

Foes: Enemies of humankind

Linda grew up in Midwest America in a small town with no real future. She hated her parents and just about everyone else around her. At the age of 19, Linda got accepted to Bean University where she received a full scholarship. She majored in power plant engineering and graduated at the top of her class. Linda was quickly hired by Freelance International and moved to New York City. Here she began work on the GIA power cell. During an experiment, she and her lab assistant were irradiated with GIA energy. Charles moved Linda to a GodTech facility to observe what would happen. First all her hair fell out. Linda didn't mind that, she always kept it short anyway. The second was her body began generating its own GIA energy. Charles decided it was too dangerous to let her return home and had Linda locked away (of course they called it observation). When GodTech got their hands on the Galactic Guardian tech, Charles quickly worked to see if he could somehow channel Linda's GIA energy. He built a modified power disk that could absorb all her excess energy. She leaked so much, that just by being near her, other power disks could recharge. During the War of the Worlds, Linda was let loose to help fight the Martians. The Galactic Guardians she worked with referred to her as the 'recharger' because she kept everyone charged. When the war finished, Charles offered her a seat in the new Star Shogun. With her power and the skill of the pilot, the Star Shogun could be a powerful weapon for good. Linda agreed, stating that she wasn't going back to her damn hospital room. Since then she has picked back up her research of GIA energy, trying to find a possible cure so she doesn't have to always wear her power disk.

GodTech Galactic Guardian Form

Star Shogun

Built after the War of the Worlds, the Star Shogun was designed to fight the alien threat in space instead of on human soil. It has been equipped with enhanced armor and weapons from the dimensional forge of the Galactic Guardians. The Star Shogun has engines built into its feet allowing it atmosphere to space travel in seconds. The cockpits each have a stasis bubble protecting the pilots from the effects of high velocity, but still allowing for complete control over the machine. The controls for the Star Shogun are part manual, part mental. The weapons and support systems run by triggers, while movement is carried out by thought and linked through the pilot's helmet. This gives the Star Shogun quicker than normal reflexes. When it was first built, the Galactic Guardians demanded that GodTech hand it over, but Spector appeared and reminded the off-worlders that they had brought an imbalance to Earth and the Star Shogun is rightfully GodTech's. The members of GodTech offered the Star Shogun's services to the Galactic Guardians if they ever needed it, with its current crew. After that the issue was dropped. The Star Shogun is based on an asteroid that orbits the moon. The facility is manned by about a dozen GodTech staffers and hundreds of machines. It is also cloaked from normal sensors.

A Note About Star Shogun's Stats:

The missing Stats require a pilot's own Stat and Special Focus. Same with Smarts. Because this is a robotic vehicle, missing Stats are not filled in for the sake of Health and WILD. You just add the Stats you have together. Health represents BODY. WILD is used just like it normally would be.
